As a Senior Developer, I would suggest that the "Not allowed to load local resource" error in Chrome is usually due to security reasons. Chrome and other browsers restrict access to local files to prevent malicious attacks. One way to fix this issue is to set up an HTTP server on your computer and serve the files locally. This way, the files will not be fetched from the network, and Chrome will stop blocking them.

Another solution is to use a browser extension such as "Web Server for Chrome" which allows you to start a simple server and choose the folder you wish to work with. You can then go to the URL (like 127.0.0.1:port you chose) and access your local resources.

You could also try restarting the browser, as sometimes the issue can be resolved by clearing temporary glitches.

I hope this helps! Let me know if you have any further questions.
